Written for the forensic science student and professional practitioner, *The Scientific Method in Forensic Science* provides an experience-based learning opportunity for understanding the scientific method and evidence-based analysis as they relate to forensic science in a Canadian context. Underscoring the importance of these concepts, this handbook features real-world case and court examples that depict how scientific rigor has been incorporated into practice and the consequences when it has not. The authors explore the paradigm shift in the discipline, examining important events and reports like the Kaufman Commission and the Goudge Report; review scientific concepts and reasoning; and outline steps to critically review a journal article and conduct a literature review. They also highlight the importance of critical thinking, ethics and impartiality, the role of statistics in casework, and effective communication. Blending theory with experience-based examples and featuring thought-provoking questions, exercises, and suggestions for further reading, *The Scientific Method in Forensic Science* is an essential resource for students in forensic science, criminology, police studies, and anthropology.

The identification and quantification of material present and collected at a crime scene are critical requirements in investigative analyses. Forensic analysts use a variety of tools and techniques to achieve this, many of which use light. Light is not always the forensic analyst's friend however, as light can degrade samples and alter results. This book details the analysis of a range of molecular systems by light-based techniques relevant to forensic science, as well as the negative effects of light in the degradation of forensic evidence, such as the breakage of DNA linkages during DNA profiling. The introductory chapters explain how chemiluminescence and fluorescence can be used to visualise samples and the advantages and limitations of available technologies. They also discuss the

limitations of our knowledge about how light could alter the physical nature of materials, for example by breaking DNA linkages during DNA profiling or by modifying molecular structures of polymers and illicit drugs. The book then explains how to detect, analyse and interpret evidence from materials such as illicit drugs, agents of bioterrorism, and textiles, using light-based techniques from microscopy to surface enhanced Raman spectroscopy. Edited by active photobiological and forensic scientists, this book will be of interest to students and researchers in the fields of photochemistry, photobiology, toxicology and forensic science.
