Principles of ion exchange This chapter provides a general introduction to the theoretical principles that underlie every ion exchange separation. An understanding of these principles will enable the separation power of ion exchange chromatography (IEX) to be fully appreciated. Practical aspects of performing a separation are covered in Chapter 2.

Ion Exchange Chromatography & Chromatofocusing

General description This Handbook contains the latest information on the theoretical and practical aspects of ion exchange and chromatofocusing techniques, the prepacked columns and media available, and how to select them.

Ion exchange chromatography (IEX) separates proteins with differences in surface charge to give high-resolution separation with high sample loading capacity. The separation is based on the reversible interaction between a charged protein and an oppositely charged chromatography resin.

For in-depth information about HIC, download our HIC handbook. How does hydrophobic interaction chromatography work? Proteins with different degrees of surface hydrophobicity can be separated using hydrophobic interaction chromatography. The proteins are bound to the hydrophobic ligand on the HIC resin in a binding buffer with a high salt concentration. When the ionic strength of the buffer is ...

In ion exchange chromatography, for example, the pH optimum will change when conductivity is changed. Thus, with the one-factor-at-a-time experimental setup, there is a great risk that the true optimum for the studied process is not identified.
