Abstract The purpose of these research is to forecast volatility using dierent GARCH (General autoregressive conditional heteroekedasticity) models in order to test which model has best forecasting ability. The focus of this research is the US market. The data is composed by NASDAQ-100 quotations from 1986 to 2016.

### Forecasting volatility using GARCH models

A change in the variance or volatility over time can cause problems when modeling time series with classical methods like ARIMA. The ARCH or Autoregressive Conditional Heteroskedasticity method provides a way to model a change in variance in a time series that is time dependent, such as increasing or decreasing volatility. An extension of this approach named GARCH or Generalized Autoregressive Conditional Heteroskedasticity allows the method to support changes in the time dependent ...

### Volatility Forecasting I: GARCH Models

The idea of the GARCH model of price volatility is to use recent realizations of the error structure to predict future realizations of the error structure. Put more simply, we often see clustering in periods of high or low volatility, so we can exploit the recent volatility to predict volatility in the near future.

Written by Carl R. The purpose of this study is to model and forecast the volatility of the FTSE 100 index returns using Generalised Autoregressive Conditional Heteroscedasticity (GARCH) models (Bollerslev, 1986; Bollerslev, 1990; Bollerslev and Engle, 1986; Engle, 1982; Engle, 2001). The GARCH model with t-distribution brings significant results in the ARCH and GARCH effects; Table 1 provides the output of the complete regression.

This thesis examines the volatility forecasting performance of commonly used forecasting six models: the simple moving average, the exponentially weighted moving average, the ARCH model, the GARCH model, the EGARCH model and the GJR-GARCH model. The dataset used in this report are three different Nordic equity indices, OMXS30, OMXC20 and OMXH25.

### Volatility Forecasting Performance: Evaluation of GARCH ...

The family of ARCH and GARCH models has formed a kind of modeling backbone when it comes to forecasting and volatility econometrics over the past 30 years. They were originally fit to macroeconomic time series, but their key usage eventually was in the area of finance.

We examine the properties and forecast performance of multiplicative volatility specifications that belong to the class of generalized autoregressive conditional heteroskedasticity-mixed-data sampling (GARCH-MIDAS) models suggested in Engle, Ghysels, and Sohn (Review of Economics and Statistics, 2013, 95, 776-797). In those models volatility is decomposed into a short-term GARCH component and a long-term component that is driven by an explanatory variable.

In the context of high volatility in crude oil prices, I have investigated and presented a hybrid time-varying long memory GARCH and simulations based forecast model which considers volatility facts such as asymmetry and heteroscedasticity, time-varying risk, long memory and heavy tail distribution. Empirical evidences suggest that Crude data with Brownian motion tend to show some degree of predictability in their temporal dynamics.

### Forecasting Volatility in Stock Market Using GARCH Models

The GARCH-family of models describes the variation of one-step (i.e., local) volatility over time, but, in practice, we need volatility values that span multi-steps (i.e., global or term). In this paper, we will prepare both the local and the term volatilities over the next 12 months.

NAGARCH. Nonlinear Asymmetric GARCH(1,1) (NAGARCH) is a model with the specification:  $\sigma_t^2 = \omega + (\alpha_1 - \beta_1) \epsilon_{t-1}^2 + \beta_1 \sigma_{t-1}^2$ , where  $\alpha_1 \geq 0$ ,  $\beta_1 > 0$  and  $(\alpha_1 + \beta_1) < 1$ , which ensures the non-negativity and stationarity of the variance process.. For stock returns, parameter  $\omega$  is usually estimated to be positive; in this case, it reflects a phenomenon commonly referred to as the "leverage effect", signifying that negative ...
